They reported yesterday that one out of 108 fish died. While that is a very low mortality rate, it's too early to make conclusions. It may take several days for sediment in gills to affect health. I'll see if I can get a new report today.

Also, the BOR has increased releases at Navajo Dam in New Mexico in order to try to protect aquatic life in the San Juan River.

Catching up on some emails so sorry if newer information is available. Received a question about this yesterday evening so would be good to know what the results were.

I just spoke with Director of CO FW&P. They will call me with data about their fish cage and would like us to disseminate that information in our statements.
